Engineering overview

Engineering and project execution for Autoclaved Aerated Concrete manufacturing plants, from feasibility and process selection through plant setup, commissioning and operational support.

Key capabilities

- High-end automation and process control
- Expansion-ready plant planning
- Minimal-manpower production concepts
- Resource and yield optimisation focus
- Project support from concept to commissioning

AAC Plants

Illustrative source asset

Source basis: Buildmate AAC Plants page and published AAC brochure material

Technical notes

01 Plant capability

Buildmate's current AAC material states a published plant-capacity range of 200-2000 m³/day and describes customized solutions, automation, resource optimization and expansion scope.

02 Process focus

Typical AAC production stages are raw-material batching, casting, cutting, autoclave curing and palletizing. Final configuration is selected around raw materials, product requirements, output targets and site conditions.

Verified source basis: Buildmate AAC Plants page and published AAC brochure material

Technical notes

03 Engineering approach

Services span feasibility, DPR, process design, project management, construction management, commissioning, training, maintenance and after-sales support.

04 Planning considerations

Project planning should verify raw-material availability, utilities, product mix, land, logistics and future expansion before final plant engineering.

Verified source basis: Buildmate AAC Plants page and published AAC brochure material

Project discussion

Share the target product, required output, raw-material route, site location and project stage for a technical discussion.
